Facebook

An online social media and social networking service based in Menlo Park, California.

LinkedIn

A business- and employment-oriented social networking service that operates via websites and mobile apps

Twitter

A service for friends, family, and coworkers to communicate and stay connected through the exchange of quick, frequent messages

YouTube

First large-scale video sharing website that makes it easy to watch videos online

Instagram

The home for visual storytelling for everyone from celebrities, newsrooms and brands, to teens, musicians and anyone with a creative passion.

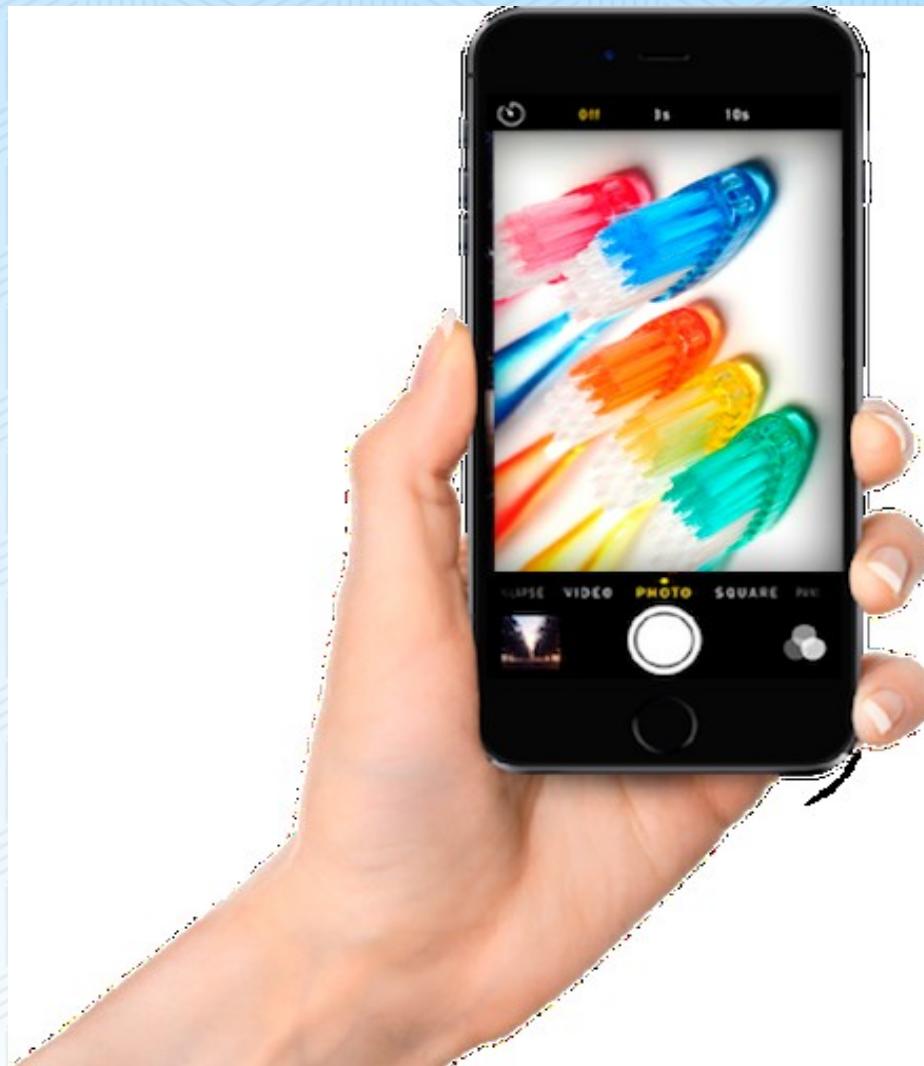

Tumblr

Lets you effortlessly share anything. Post text, photos, quotes, links, music, and videos from your browser, phone, desktop, email.

Pinterest

A visual bookmarking tool that helps you discover and save creative ideas.

Hashtags can also be used in Facebook posts

The image shows a Facebook post by Pembe Oltulu. The post includes a profile picture, the author's name, the date, and sharing options. Below the post are two images: a gross specimen of a thyroid nodule and three histological micrographs labeled A, B, and C. A red arrow points from the text "Hashtags can also be used in Facebook posts" to the hashtags "#pathology" and "#pathologists" in the post. Another red arrow points from the text "Click this arrow for dropdown menu of options for a post" to the dropdown arrow icon in the top right corner of the post area. A third red arrow points from the text "Notifications can be turned on to follow a post & be notified of any comments on it" to the "Turn on notifications for this post" option in the dropdown menu.

ATYPICAL FIBROXANTOMA

Pathpresenter

Beware of this diagnosis in shave and superficial biopsies. If epithelial/muscle markers and S-100 are negative a diagnosis of atypical intradermal fusocellular neoplasia is appropriate.

Complete excision is critical to confirm :

Hello histo friends.

Need some help here.

What cud be the cause of slides becoming like this..

It seems like after dehydrate..the slides are clear...when it comes to mounting..it has becoming like that.

Under the microscope a lot of debris on the tissue section.

Temporary solution:

Filter the eosin on monday morning.. results is good

Towards the week end...it happens again.

Not sure the cause is at the dehydrate parts or mounting medium...?

Please help. Thank u in advance.

Reed Sternberg cell variants @pathology Lab
#pathology#pathologists#hemopath

Traduzir Tweet

Hodkin lymphoma tumor cell = neoplastic giant cell called Reed-Sternberg (derived mainly from B-lymphocyte line). These cells release cytokines that induce the accumulation of reactive lymphocytes, macrophages and granulocytes, which typically make up greater than 90% of the tumor cellularity.

diagnosis = identification of Reed-Sternberg cells + immunohistochemistry

Reed-Sternberg cell variants:

CAP Laboratory Improvement Programs

Human Papillomavirus Testing in Head and Neck Carcinomas

Guideline From the College of American Pathologists

James S. Lewis Jr, MD; Beth Beadle, MD, PhD; Justin A. Bishop, MD; Rebecca D. Chernock, MD; Carol Colacicco, MLS, SCT(ASCP); Christina Lacchetti, MHSc; Joel Todd Moncur, MD, PhD; James W. Rocco, MD, PhD; Mary R. Schwartz, MD; Raja R. Seethala, MD; Nicole E. Thomas, MPH, CT(ASCP)CM; William H. Westra, MD; William C. Faquin, MD, PhD

Context.—Human papillomavirus (HPV) is a major cause of oropharyngeal squamous cell carcinomas, and HPV (and/or surrogate marker p16) status has emerged as a prognostic marker that significantly impacts clinical management. There is no current consensus on when to test oropharyngeal squamous cell carcinomas for HPV/p16 or on which tests to perform.

The major recommendations include (1) testing newly diagnosed oropharyngeal squamous cell carcinoma patients for high-risk HPV, either from the primary tumor or from cervical nodal metastases, using p16 immunohistochemistry with a 70% nuclear and cytoplasmic staining cutoff, and (2) not routinely testing nonopharyngeal carcinomas or nonoropharyngeal or HPV. Pathologists are to report tumors as + or p16 positive. Guidelines are provided for tissue samples and handling of locoregional and recurrence specimens.

—Based on the systematic review and on consensus, high-risk HPV testing is recommended new oropharyngeal squamous cell carcinomas, but not routinely recommended for other head and neck carcinomas.

The CAP Guideline indicates a few cases when p16 is not enough! e.g. metastatic keratinizing SCC of unknown primary site to a cervical LN #pathjc

Participation of multicentric studies

TRABALHOS CIENTÍFICOS

#EBUSTwitter

- 25 pathologists from 16 institutions in five countries within 143 days of study conception.
- The average study participant reported meeting offline (in real life) with only 3 participant.
- 287 cases

CONCLUSIONS: We demonstrate a novel use for social media as an effective tool to design and implement a multi-institutional, international pathology study. Social media was a powerful tool of identification of a rare histologic finding in diverse practice settings, rapid participant recruitment, and conception, design and execution of a collaborative pathology study.
